

# Seating people on an airplane

---

## Peter Tsun

---

An update to seating-plane code is to ensure all three family members are seated in the same row. The problem with this is that the family of three may have to try the next plane or another airline if there are many families of two that prevent a seating of all three family members in the same row. It would be safer for children to be next to their families to prevent crimes (like kidnapping and bullying) against children, but the family of three may not be able to find a plane with all three seats in the same row. Also, it may be hard to write a program to accomodate for families with more than three people. It may become complex to keep track of mulitple rows for the same family with a large number of people.
